

Cyber-Human Risk & Behavioral Analysis Report

1. The Human-Centric Security Model

In the digital landscape of 2026, the human element remains both the greatest vulnerability and the strongest defense. This report quantifies the correlation between psychological readiness (training) and technical vulnerability (phishing), aiming to build a more resilient and humanized digital ecosystem.

2. Analytical Methodology

The analysis utilized 500 security logs and employee performance metrics. By calculating a 'Human Risk Score' based on phishing interactions and security awareness scores, we pinpointed high-risk behavioral patterns across the organization.

3. Visual Risk Assessment

Chart 1: Correlation between Security Training and Phishing Susceptibility.

Cyber-Human Risk & Behavioral Analysis Report

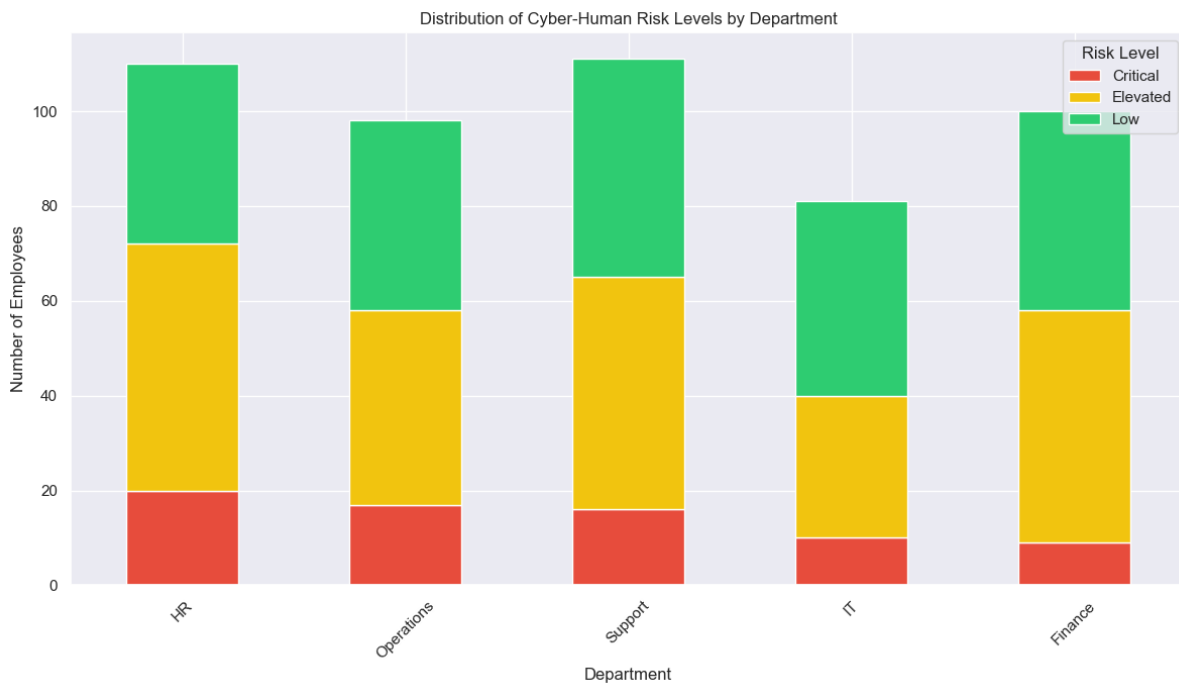

Chart 2: Departmental breakdown of critical cyber-human risk levels.

4. Strategic Directives for Resilience

- Institutionalize a 'Human Firewall' culture through continuous micro-learning.
- Deploy psychological first aid in departments facing high digital stress.
- Leverage behavioral analytics to create personalized security awareness paths.
