

Data Science Ecosystem: Consumer Behavior Report

1. Human-Centric Data Vision

This project explores the intersection of data engineering and psychological capital. By analyzing user journeys, we aim to build digital environments that are not only efficient but also humanized.

2. Ecosystem Methodology

A synthetic big data environment was simulated featuring 500 unique user sessions. Key metrics include device segmentation, session depth, and conversion probability models.

3. Behavioral Insights

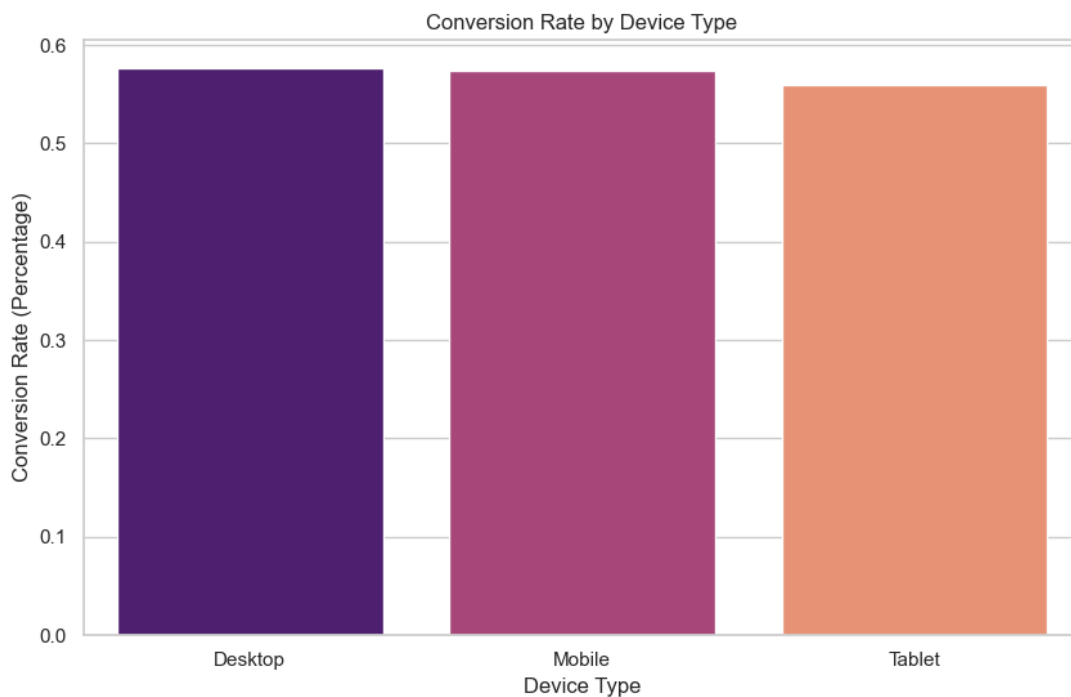

Figure 1: Comparison of conversion rates between Mobile, Desktop, and Tablet users.

Data Science Ecosystem: Consumer Behavior Report

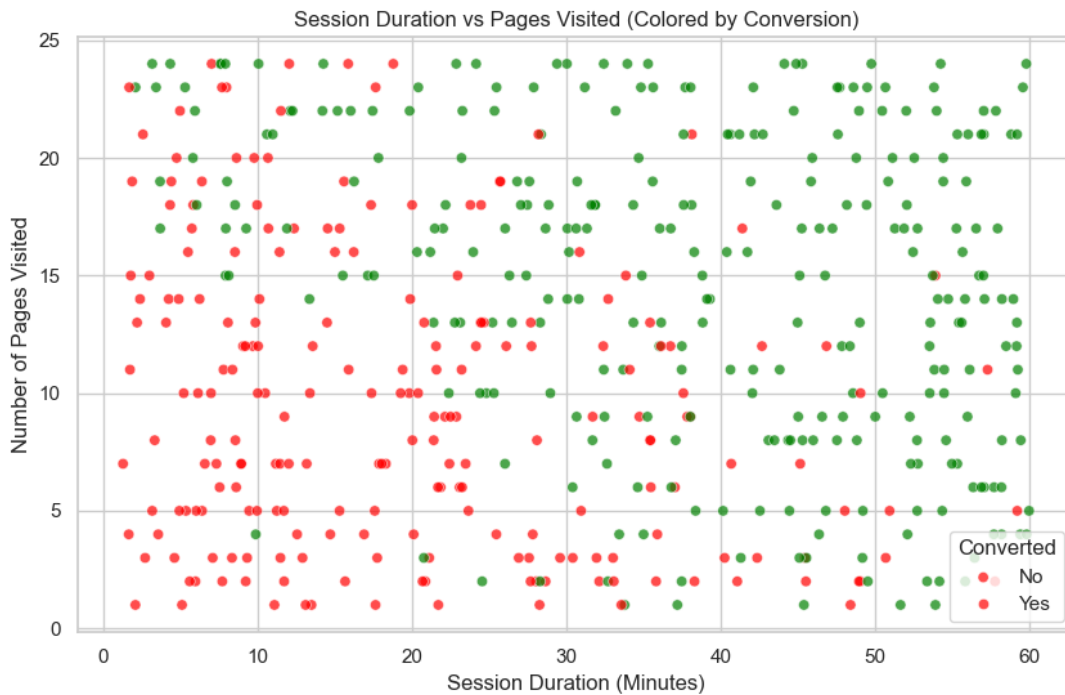

Figure 2: Correlation between session duration and pages visited.

4. Strategic Recommendations

1. Optimize Mobile UX to bridge the conversion gap between devices.
2. Focus on psychological engagement points to extend session duration.
3. Implement predictive models to humanize digital workplace environments.
